## Please stick your results here

(including the iQC report)  
(You may remove any patient data however all other information should be clearly visible please)

The VETSCAN VS2 has an intelligent Quality Control (iQC) that automatically verifies the integrity of samples, chemistries and analyzer performance during each run. It automatically suppresses either a single chemistry or the entire panel if it detects any endogenous substance interference by printing flags instead of results (---, HEM, LIP or ICT, iQC Code)

Moreover, the run can be cancelled due to a rotor failure.

This ensures that accurate results are reported, and it prevents misinterpreting of results that could be affected by sample quality issue

**In line with GDPR guidelines we will not process any patient data, please follow your own practice GDPR policies when sharing data**
