## PROVEN PROTECTION

Clostridial bacteria thrive in the same environment as herds and flocks – soil, pasture, farm buildings and even internal organs. Most of the time the bacteria lie dormant, but they can be triggered into devastating action by the simplest things – a change of management, new feed, parasitic activity or an injury, for example – which can lead to a release of toxins that may attack the muscles, gut and liver. This leads to severe disease and, very frequently, death.

- Bacterial redwater
- Black disease
- Blackleg
- Braxy
- Enterotoxaemia
- Gas gangrene
- Haemorrhagic enteritis
- Lamb dysentery
- Pulpy kidney
- Tetanus

Clostridial diseases are a well known cause of sudden death in sheep but also affect cattle.

Good management will help control the triggering factors, but on its own it won't provide protection. Covexin 8 provides sheep with the antibodies they need to fight the devastating toxins produced by clostridial bacteria. It's a low-dose vaccine which can be used on lambs as young as 2 weeks.
